TITLE: Design of waveguide phase shifters with a laterally shifted dielectric

SOURCE: Warsaw. Przemyslowy Instytut Telekomunikacji. Prace. v. 16, no. 51,
1966, 9-21

TOPIC TAGS: phase shifter, waveguide, critical wavelength, dielectric constant

ABSTRACT: Problems of designing waveguide phase shifters with a laterally shifted dielectric are discussed. Phase shifters of this type are built on the basis of a rectangular waveguide with the mode H_{01} . The dielectric insert placed in the waveguide causes the wavelength in the waveguide to change, i. e., the electrical length of the waveguide section which contains the dielectric insert changes. Approximate relations of effective dielectric permeability depending on the position and dimensions of the insert and on the dielectric constant are derived. The phase shifter must have great power and above-critical attenuation of the higher

Card 1/2

L 47412-66
ACC NR: AT6028776

wave modes. Both of these qualities depend on the lateral dimensions of the insert and on the dielectric constant of the material used to make the insert. The introduction into the waveguide of the dielectric insert causes the appearance of reflections from the ends and carrying supports. The insert ends must be provided with matching transformers, and supports with suitable diameters must be located in such a way that the reflections from them will compensate each other. The above considerations were used as a basis in designing the waveguide phase shifter with a laterally shifted dielectric. The results of measurements of this waveguide phase shifter make it possible to introduce empirical corrections to the equation on the wavelength in the waveguide with a dielectric insert near the side wall and in the middle of the waveguide. TITLE: Controlled waveguide polarizer

SOURCE: Warsaw. Przemyslowy Instytut Telekomunikacji. Prace, v. 15,
no. 49/50, 1965, 45-56

TOPIC TAGS: waveguide, rectangular waveguide, phase shifter, waveguide
polarizer, polarizer

ABSTRACT: The paper deals with the basic principle of a variable waveguide polarizer built into a square waveguide. A smooth transition from the rectilinear to a square waveguide produces excitation in the latter of H_{10} and H_{01} waves of equal amplitude and phase. An adjustable phase shifter changes the phase difference between the modes. As a result, an elliptically polarized wave is obtained in a square waveguide. The transition transmits elliptically the polarized wave to another square waveguide which is twisted 45 deg around the axis of the

Card 1/2

UDC:621.372.8

L 39919-60

ACC NR: AT6018333

first one and the walls of which are parallel to the walls of a rectangular waveguide. The elliptically polarized wave may be treated here as a wave composed of two new waves differing in phase by 90 deg, with an amplitude which may be effected by adjusting the phase shifter. The second phase shifter permits a change in the phase difference between these two waves by changing simultaneously the position of ellipse-axis angle. The polarizer is so designed that it can produce an arbitrary polarized wave. The phase shifter of a square waveguide has dielectric plates. An experimental polarizer was designed for the 8-mm band in a square waveguide of 4.9 x 4.9 mm. The measurements show good performance by the polarizer. The latter permits a circular polarization ratio of 0.99 and a linear polarization ratio 0.1 in both the vertical and horizontal planes. Orig. art. has: 9 figures and 62 formulas. TITLE: Remark on the generalization of Kane's model of the band structure of HgTe

SOURCE: Physica status solidi, v. 15, no. 1, 1966, K9-K11

TOPIC TAGS: valence band, conduction band, mercury compound, tellurium compound, semiconductor band structure

ABSTRACT: Three particular cases of the role of the parameters in the secular equation for the interaction matrix for the unperturbed valance band (*p*-symmetry) and the two lowest unperturbed conduction bands (*s*- and *p*-symmetry) are examined. The equation being discussed was derived earlier by the author (*Phys. stat. sol.*, 11, K131 (1965)). The cases are: $\gamma = \delta = 0$; $\gamma = 0$, δ arbitrary; γ and δ arbitrary. The analysis concludes that if only interactions between the three bands are being considered, only the third case is of practical significance. The effective masses in the first two cases are equal to the mass of the free electron and this contradicts experiments. The author thanks Dr. M. Miasek and Dr. J. Ginter for many valuable discussions and remarks. Orig. art. has: 6 formulas.

TITLE: Remark on the generalization of Kane's model of the band structure of HgTe

SOURCE: Physica status solidi, v. 11, no. 2, 1965, K131-K134

TOPIC TAGS: crystal lattice structure, crystal symmetry, semiconductor band structure, mercury compound, telluride

ABSTRACT: HgTe, a compound of the ZnO-type, is representative of a new class of semiconductors having zero thermal and non-zero optical gaps. Kane investigated the band structure of ZnO-type compounds by starting with the Schroedinger equation

$$\left[\frac{p^2}{2m} + V + \left(\frac{\hbar}{m} \right)^2 g + \left(\frac{\hbar^2}{4m^2 c^2} \right) (\nabla V \times g) \vec{\sigma} + \left(\frac{\hbar^2}{4m^2 c^2} \right) (\nabla V \times g) \vec{\sigma} \right] u_i(r) = E_i' u_i(r), \quad (1)$$

$$E_i' = E_i - \left(\frac{\hbar^2}{2m} \right) g^2,$$

where E_i' denotes the energy of a state with a wave vector and $u_i(v_0)$ gives the cell-periodic function. He assumes that solutions of $\left[\frac{p^2}{2m} + V \right] u_i = E_i u_i$

Card 1/2

L 29995-66

ACC NR: AP5024762

are known. These are used as unperturbed solutions of (1) and the effect of other terms is taken into account by a perturbation calculation by considering the interaction between the valence band and one conduction band. Then the effect of other bands is considered and the interactions given by the 5-th term in (1) are noted. Consider the interaction between three bands: a valence band with symmetry p , a conduction band with symmetry s and another conduction band with symmetry p as a generalization of Kane's model. Take the wave vector R in the z direction and consider the Hamiltonian corresponding to the first four terms of equation (1). The matrix of the interactions has the form

$$\begin{bmatrix} \chi(s) & 0 \\ 0 & \chi(s) \end{bmatrix}$$

$\chi(s)$ can be expressed as a matrix using symmetries due to the geometry of the crystal and time reversal. The secular equation cannot be solved exactly but for $R=0$, the secular equation is solved exactly for the matrix $\chi(0)$ giving five roots. The solution for small R will be given in a future paper. The author wishes to thank Dr. M. Miasek for suggesting the present work and for very valuable discussions and Professor M. Suffczyński for many discussions. Orig. art. has: 8 formulas.

"Wydobycie wysokoprócentowego antracenu i karbazolu z gospodarczej antyczyny", Przemysł Chemiczny, No. II, 1954, pp. 411-415,
3 figs., 1 tab.

A new cretol-phenole method is described, by means of which it is possible to isolate from raw anthracene 97 per cent pure carbazole, free from phenanthrene. Productivity is 6.0 per cent of the total amount of raw anthracene used (nearly 100 per cent). Anthracene of 91 per cent purity is obtained at the same time, productivity being 20.0 per cent of the quantity of raw anthracene. The method is suitable for introduction on an industrial scale, if cyclical circulation of the solvents used in the process is used.

Abstract: Presented are the characteristic and composition of semicoking coal tar. Distillations of crude oil are used as examples in considering the possibility of formation of various types of azeotropic mixtures. An attempt is made to effect partial separation of fractions by azeotropic distillation with phenol and acetic acid. Noted are the differences between petroleum, high and low temperature tars from the standpoint of the formation of polyazeotropic mixtures. It is shown that acetic acid forms with mesitylene an azeotropic mixture boiling 0.03° lower than acetic acid.

✓ Rapid method for determination of stability of pressed yeast. Jindrich Gerasimkin. *Prace Inst. Lab. Radovozek Praze, 1954, Volume 5, No. 2, p. 36* (1956) (English summary). Two methods were worked out. The first one was based on determination of the amino-N content by means of Sorenson's method. The following correlations were obtained: stability above 90 hrs., 2.32-0.81 mg./100 ml.; stability of 60 hrs., 0.5-0.8 mg./100 ml.; stability less than 60 hrs., over 10 mg./100 ml. The 2nd method was based on glycogen content, determined by the method of Kornblum. The following correlations were obtained: stability above 90 hrs., more than 6%; stability of 60 hrs., 2-6%; stability less than 60 hrs., less than 4%.

Title: Development of a Rapid Procedure for Determining the Stability of Baker's Yeast

Original

Publication: Przem. spozywczy, 1956, 10, No 4, 181-182

Abstract: Experimental storage of pressed baker's yeast (Y) at 35, 40, 45 and 50° has revealed the absence of a relationship between stability of Y, temperature of storage and increase in amino-nitrogen during the period of storage, and, conversely, the existence of a correlation between the initial content of amino-nitrogen or glycogen in the Y and stability of the latter. It was found that the amino-nitrogen content is: in Y of above-standard stability 2.2-6.5 mg/g; in Y of standard range stability, 6.5-9.8 mg/g and in Y of below-standard

Card 1/2

Poland/Chemical Technology. Chemical Products and Their Application -- Fermentation industry, I-27

Abst Journal: Referat Zhur - Khimiya, No 2, 1957, 6464

Abstract: stability, >10 mg/g. The reverse phenomenon is observed as concerns the glycogen content, which decreases with decreasing stability of Y and amounts to, respectively: in the first group >5%; in the second group 4-5%; and in the third group <4%. In the event that these data are confirmed by large scale industrial checks, the suggestion is made that the prolonged and relative procedure of determining Y stability by storage at 35°, be replaced by the method of determining the amino-nitrogen content of the Y (duration of determination <1 hour) or of its glycogen content (duration of determination ~6 hours).

TITLE: Results of observation of the solar eclipse on February 15, 1961 at 21 cm wavelength

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 5, 1962, 38, abstract 5zh264 (Solnechnye dannye, 1961, no. 7, 70-73)

TEXT: The results of observation of the partial solar eclipse on February 15, 1961, are examined. Observations were carried out in Pulkovo at 21 cm; a radio telescope with a 4m parabolic mirror and a 5 Mc/s band compensation receiver were employed, time constant being 1 sec. The curve of the variation of flow of solar radiation and also its derivative are given. Two local sources have been found with certainty, one connected with the group of spots no. 41 and the other with the floccule. The angular dimensions of the local source above the spot were 2' x 4'.6 and brightness temperature 2.1×10^{60} K; the angular dimensions of the region connected with Card 1/2

Results of observation of the ...

TITLE: Absorption of radiation due to the Sag-A source
by neutral interstellar hydrogen

PERIODICAL: Astronomicheskiy zhurnal, v.40, no.1, 1963, 17-22

TEXT: The large Pulkovo radiotelescope was used in 1961 to record the continuous spectrum of Sag-A at 21 cm. The beamwidth at half-power points of this telescope was 0.14° and 5° in the horizontal and vertical planes, respectively. The bandwidth of the receiver was 1.5 Mc/s. The average transit curves for Sag-A exhibit the structural details noted by Drake (Nat. Rad. Astron. Obs. USA, Ann. report; 2, 1959). A receiver with a bandwidth of 80 kc/s was used to investigate the absorption of Sag-A emission by neutral hydrogen in the neighbourhood of the sun and in the expanding spiral arm at 3 kpc from the centre of the Galaxy ($v = -53$ km/s). All the components of the source undergo roughly the same absorption by hydrogen in the vicinity of the sun. The radiation from the south-western part of Drake's ring ✓

ORG: Main Astronomical Observatory Academy of Sciences SSSR (Glavnaya astronomicheskaya observatoriya Akademii nauk SSSR)

TITLE: Neutral hydrogen in the region of galactic longitudes from 10° to 40°

SOURCE: Astronomichebskiy zhurnal, v. 43, no. 2, 1966, 284-290

TOPIC TAGS: neutral hydrogen, radial velocity, spiral arm, directivity diagram, galactic plane, galactic rotation

ABSTRACT: The distribution of neutral hydrogen in the Galaxy was investigated with the large radiotelescope of the Pulkovo Observatory on the 21 cm line. Galactic cross sections were made on declinations from -23° to $+6^\circ$ and selected radial velocities from -50 to +90 km/sec. The investigation range covered six spiral arms of the Galaxy. The parameters measured were: the declination of the cross section, the vertical dimension of the directivity diagram, the longitude of the cross section on the galactic plane and the number of radial velocities measured on each declination. On the basis of these parameters curves were drawn characterizing the radial velocities of the spiral arms. Schmidt's model of galactic rotation with the solar distance from the rotation center equal to 8.2 kprs was used for determining the HI concentrations according to their radial velocities. Measured results are represented

Card 1/2

UDC: 523.164.43

L 22947-66

ACC NR: AP6012736

sented graphically in the original article. Each cross section had concentrations at different distances from the galactic plane. The thickness of galactic layers was found to be from 600 to 800 prs with distances between them 1000—1500 prs. The layers are inclined to the galactic plane and are restricted in the longitude. The distant arms showed no layer structure. The author expresses thanks to T. M. Yagorov and N. F. Ryzhkov for help during the observations and S. E. Khaykin, N. V. Bystrov, and Yu. N. Pariyskiy for comments. Orig. art. has: 1 table and 10 figures. 5

REF SOURCE: Izv. Gl. astron. observ. v Pulkove, v. 24, no. 2, 1965, 202-206

TOPIC TAGS: supernova, radio telescope, cosmic radio source, centimeter wave, thin shell structure

ABSTRACT: The results of observations with the large Pulkovo radio telescope of prolonged nonthermal radio sources W 44, W 28, and W 14 are given. The dimensions of the directivity patterns at the declination of the sources are $7' \times 1^{\circ}.5$; $7' \times 4^{\circ}.5$; and $7' \times 0^{\circ}.8$, respectively, for a 21-cm wave. The luminosity distribution for the sources in a continuous spectrum does not agree with a three-dimensional model in the form of a spherically symmetric thin shell. Transmission curves at certain frequencies of the profile of the radio line of neutral hydrogen are given. An estimate of the possible upper limit of the distance to the sources is made. TITLE: Attempt to observe the hydrogen radio-frequency spectral line at the 1424.736 mc frequency in the Horseshoe and Orion Ori nebulae

SOURCE: Ref. zh. Astronomiya, Abs. 9.51.380

REF SOURCE: Astron. tsirkulyar, no. 355, fevr. 11, 1966, 2-3

TOPIC TAGS: hydrogen line, nebula, ~~Horseshoe nebula~~, ~~Orion nebula~~ radio emission, cosmic radio emission

ABSTRACT: Investigations of excited hydrogen radio-frequency spectral lines have been continuing at the Pulkovo Observatory. The RMS of measurement error of ± 0.25 km/sec is found to be lower than that of the errors determined by the profile of the line. Omega and Orion nebulae were observed in October and November 1965. Profiles were obtained of the absorption lines in these nebulae, as well as of the emission line detected in the direction of the galactic center. The ratio of maximum intensity in the line to the continuous spectrum intensity, line widths at the half-power points, the nebula velocity determined on the basis of

Card 1/2

UDC: 523.164.4

ACC NR: AR6035289

the maximum and of the center of gravity of the line, were calculated for Omega and Orion. The mean kinetic temperature for Omega and Orion were also determined. The results are somewhat different from the data of B. Hoglund and P. G. Mezger for the 5009 mc. The radiation line is narrow, $\Delta v = (270 \pm 70)$ kc, and is formed in a small compact region moving at a velocity of $-(10 \pm 1)$ km/sec.

Title : Scattering of Light in Optically Inhomogeneous Media
with Nearly Equal Indices of Refraction.

Orig Pub : Razpr. Slov. Akad. Znan. in umetn. Razpr. mat., fiz. in
tehn. vede, 1956, A7, No 3, s-37-116, il.

Abstract : After a brief survey of the theory of multiple scattering
of quanta and particles in substances, an approximate
theory is developed for single scattering of light by a
dielectrically-homogeneous sphere, immersed in a homoge-
neous medium with a slightly different index of refraction,
and for a sphere with a dielectric constant that dimin-
ishes along the radius in accordance with the Gaussian law.
The approximation of geometrical optics is used, and an
expression is derived for the probability of deflection

of the light by a given angle in the case of a sphere,
whose diameter is large compared with the wave length
of the incident light. The calculation of the phase
is made for not very large angles of deflection; no
account is taken of the refraction at the edge of the
sphere. In the wave-optics approximation, an expres-
sion is derived for the angular distribution of the
scattered light with a count for ordinary scattering,
diffraction, and interference between the scattered and
diffracted beams. The author then proceeds to describe
apparatus and the circuit for an instrument to measure
the angular distribution of scattered light, passing
through a Christiansen filter under the assumption that
the particles (dielectric spheres) are distributed at
random in a medium having a nearly the same index of
refraction. First, use is made of the geometrical-optics
approximation and of the wave-optics approximation for

/ New method for solving multiple scattering problems in
inhomogeneous media. E. Čašić (Inst. Elektroverz.
Ljubljana, Yugoslavia). Nuovo cimento [10], 5, 427-60
(1957) (in English); cf. ibid. 4, 689 (1956).—The multiple
small-angle scattering of waves is derived for scattering by
dielectric spheres in a homogeneous medium. The angular
distribution of the scattered waves is similar to that of
electrons passing through thin metal foils. G.L.C.

AUTHOR: Gosar, Peter

TITLE: On the application of the photomagnetomechanical effect in p-n junctions

PERIODICAL: Referativnyy zhurnal, Fizika, no. 8, 1962, 31 - 32, abstract 8E230
("Glasnik mat. fiz. astron.", 1961, 16, no. 1 - 2, 125 - 129,
English; summary in Serbo-Croat.)

TEXT: The author discusses the possibility of applying the photomagnetomechanical effect (observed by the author some time ago, RZhFiz, 1960, no. 2, 3845) in p-n junctions to measure light intensity. The photomagnetomechanical effect (PMME) is observed in p-n junctions of large surface and of special geometry; the n region of the semiconductor has the shape of a disk of radius a, the p region - the shape of a ring with the inner radius a and outer radius b. One half of the device is placed in a magnetic field parallel to its axis, the other half is partially or entirely illuminated. The photocurrent loops then originated envelop the entire device; there are current components perpendicular to the

On the application of the...

magnetic field which, by interaction with the current, produces a rotating moment around the axis of symmetry. When deriving the moment of force it is assumed that the longitudinal resistance of the n and p regions may be neglected. If the device is illuminated with a narrow radial bundle of light, perpendicular to the edge of the magnetic field and having a linear generation density I , then the moment of force $M = ga^3IB$. At a uniform illumination with a generation density I_0 in that half of the device in which there is no magnetic field, $M = ha^4I_0B$. B is the magnetic induction, g and h dimensionless functions of a/b which, for a/b somewhat greater than $1/2$, have maximums equal to a few hundredths. The PMME is proportional to the light intensity and can be measured by the rotation speed of the device around the axis of symmetry or by the angle of rotation, if the device is suspended on an electric wire or strip. For the manufacture of the device the same materials may be employed as in photodiodes and photoelements. On a uniform sun light illumination (10^5 lux) of one half of a Si device with an optimum width of the ring, the current density is ~ 30 mA/cm² and $M = 0.2$ dyne.cm if $a = 1$ cm and $B = 10^3$ Gauss. By weighing on a strip of phosphorous bronze, illuminations of the order of more than 500 lux can be measured. The use of a quartz wire enables one to measure low illuminations of the order of 10 lux and less.

95. Construction and lowering of the arches of
bowstring bridges. — W. Goschy und H. Trager.
(Méthodes d'abaissement des arches de ponts à arc,
Szemle, Vol. 1, 1954, No.
6, pp. 283—288, 12 figs.)

The highway bridges over the Eastern Main
Canal which branches off the Tisza river at the Tiszakök
barrage were designed as two-hinged reinforced
concrete bowstring arches with cable ties. The cables
were made of high-tensile steel with a low Young's
modulus, the consequence of which was a high
degree of elongation. This caused horizontal and
vertical deformations of the arches thereby in-
fluencing the construction of the arches and the
final state of the bridge. The conventional methods
